
Urgent & Critical: Pre-Class Preparation for Netflix India Revenue Crisis Session

Dear Batch,

This upcoming session will be a high-stakes simulation designed to expose you to real-world data analytics challenges under immense pressure. We are diving deep into an immediate and critical situation at Netflix India.

The Crisis:

Netflix India is facing a severe Q4 revenue crisis. The CEO, has issued an urgent directive: Q4 revenue significantly missed targets (2,420 Cr against 2,847 Cr), and the company is losing premium subscribers while a competitor gains market share. The board meeting is in a mere 90 minutes, and the stock is down 8%. This is a "make-or-break" moment.

Your Role:

You will step into the shoes of Netflix India's Senior Analytics Team. Your ability to rapidly dissect this crisis, pinpoint root causes, and formulate actionable, data-driven solutions is paramount.

YOUR PRE-CLASS TASK: IMMEDIATE DATA PREPARATION

To hit the ground running during our in-class simulation, it is **absolutely critical** that you come prepared with the provided datasets thoroughly cleaned and standardized. We have given you "corrupted" data – reflecting the reality of messy industry datasets. Your ability to quickly prepare this data is the first test of your analytical readiness.

The Data Files (4 Corrupted Datasets):

1. **Subscriber Data (Netflix.xlsx - USER DATA.csv)**: Contains information about Netflix India subscribers.
2. **Content Performance Data (Netflix.xlsx - CONTENT PERFORMANCE.csv)**: Details on various content titles, their performance, and costs.
3. **Regional Revenue Data (Netflix.xlsx - Revenue Data.csv)**: Daily revenue figures, subscriber counts, and churn rates across different cities.
4. **Demographics Data (Netflix.xlsx - Regional Demographics.csv)**: Demographic information for various Indian cities.

Critical Data Issues You MUST Resolve (Before Class):

Be prepared to have fixed the following common data quality issues:

- **City names:** Inconsistencies like "Mumbia", "Delhii", "Bangalor". Standardize them to a consistent format.
- **Plan types:** Inconsistent casing and naming conventions such as "PREMIUM", "premium_plan", "Premium". Standardize these uniformly.
- **Revenue formats:** Mixed numerical and textual formats like "25L", "2.5Cr", "2500000". Convert all revenue figures to a consistent, usable numeric format.
- **Date chaos:** A mix of DD/MM/YYYY and MM/DD/YYYY formats. Standardize all dates.
- **Missing data:** Identified by values like [WEEKEND_GAP], N/A, or blank cells. You must handle these appropriately.
- **Duplicates:** Be aware of approximately 2% duplicate records that will skew your analysis if not addressed.

WHAT TO EXPECT IN CLASS (The Real-Time Simulation):

Our session will immediately dive into real-time problem-solving. With your cleaned data ready, we will simulate how to:

- Approach such time-sensitive, high-pressure business problems.
- Conduct critical analysis to identify the root causes of the crisis (e.g., what caused the 427 Cr revenue drop? Which customer segments are churning? What content is failing vs. succeeding? How do regional markets differ?).
- Formulate data-driven strategic recommendations for a recovery plan.

This experience will provide you with a tangible understanding of how data analysts operate under real industry constraints.

Important Note: Your ability to complete the data cleaning effectively before the session is paramount. **You must come to class with your datasets cleaned and ready for analysis.** This will ensure you can fully participate in the critical analytical phase of the simulation.

Please note - Anyone can be asked to explain the dataset, we expect you to go through all the business terms mentioned in the dataset.

Prepare to be challenged. Prepare to deliver.

Best regards,
